Novel multimeric or heterodimeric cytokine receptors useful for treating chronic inflammatory disease such as inflammatory bowel disease, ulcerative colitis, acute inflammatory disease such as endotoxemia,

Disclosure; SEQ ID NO 108; 205pp; English.

Creceptor (II) having at least one polypeptide having 90 percent sequence condensity with a 732 (S1) or 649 (S2) amino acid sequence given in Specification, and where (I) binds a ligand comprising a 164 (S3) amino coid sequence, given in specification, or at least one polypeptide comprising residue 20-227 of (S1). (I) is useful for killing cancer cells and producing an antibody to (I) and a cytokine-binding domain of a class I cytokine receptor. A composition (C1) comprising (I) and a cytokine-binding domain of a class I cytokine receptor and a vehicle is useful for: reducing hematopoietic cells and hematopoietic progenitor cells in a mammal; inhibiting zcytor1711g-induced proliferation or differentiation or differentiation of inflammatory disease in which zcytor1711g plays a role. The disease is a cute inflammatory bowel disease is a cute inflammatory disease such as inflammatory disease such as inflammatory disease. A copic dermatitis, eczema and confidential control of inflammatory composition is useful for inhibiting an inflammatory response inhibiting composition is useful for inhibiting an inflammatory response inhibiting composition is useful for suppressing an inflammatory response inhibiting composition is useful for suppressing an inflammatory response in a mammal exposed to an antigen or pathogen. An antibody that specifically binds to (I) is useful for detecting the presence of a multimeric or heterodimeric cytokine receptor in a biological sample. This sequence encodes a human zcytor17 receptors. describes an isolated multimeric or heterodimeric cytokine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes haematopoietic receptor NR10 splicing variants (1). (1) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietin receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence encodes the human NR10.3 protein from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 4315
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           No.:

                                                       The present invention describes a cytokine receptor designated zcytor17. CC Zcytor17 has immunomodulatory, antiinflammatory, antiviral, cytostatic, antiarthratic and muscular activities. The zcytor17 CC antirheumatic, antiarthratic and muscular activities. The zcytor17 CC proteins are useful for treating and diagnosing lymphoid, immune, inflammatory, spleenic, blood or bone diagnosing lymphoid, immune, zcytor17 antibodies are useful in stimulating cell-mediated immunity and for stimulating lymphocyte proliferation, such as in the treatment of infections involving immunosuppression, including certain viral infections. They are also useful for inducting cytotoxicity and for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating leukopenias. Antagonist of zcytor17 polypeptides are useful for treating autoimmune diseases (e.g. rheumatoid arthritis and multiple sclerosis), inflammatory diseases (e.g. Crohn's disease), cancer, cancer, and inflammatory bowel disease. Zcytor17 was mapped to chromosome 5, specifically to the 5q11 chromosomal region. ABA93767 to ABB93843 and ABB95730 to ABB95745 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zcytor17; chromosome 5; 5q11; cytokine receptor; immunomodulatory; antivitral; antirheumatic; antiarthritic; cytostatic; muscular; lymphoid; immune; inflammatory; spleenic; blood; bone; infection; immunosuppression; cytotoxicity; leukopenia; Crohn's disease; autoimmune disease; rheumatoid arthritis; multiple sclerosis; cancer; inflammatory disease; pancreatitis; inflammatory bowel disease; ss.

The invention describes an isolated multimeric or heterodimeric cytokine receptor (I) having at least one polypeptide having 90 percent sequence cidentity with a 732 (S1) or 649 (S2) amino acid sequence given in specification, and where (I) binds a ligand comprising a 164 (S3) amino acid sequence, given in specification, or at least one polypeptide comprising residue 20-227 of (S1). (I) is useful for killing cancer cells and producing an artibody to (I) and a cytokine-binding domain of a class I cytokine receptor. A composition (C1) comprising (I) and a cytokine-binding domain of a class I cytokine receptor and a vehicle is useful for: reducing haematopoietic cells and hematopoietic progenitor cells in a mammal; inhibiting zcytor1711g-induced proliferation or differentiation of hematopoietic cells and hematopoietic progenitor cells; reducing cytor1711g-induced inflammatory disease in which zcytor1711g a mammal afflicted with an inflammatory disease such as inflammatory bowel disease is a cute inflammatory disease is acute inflammatory disease such as fortiaries for the colitis. Crohn's disease, atopic dermatitis, eczema and pservices of a content of the colitis of the colitis and the colitis and the colitis of the colitis of the colitis and the colitis and the colitis of the colitis of the colitis and the colitis of the colitis of the colitis of the colitis and the colitis and the colitis of t septicaemia, toxic shock syndrome and infectious

An inflammatory response inhibiting composition is useful for suppressing an inflammatory response in a mammal with inflammation. An antibody that specifically binds to (I) is useful for detecting the presence of a multimeric or heterodimeric cytokine receptor in a biological sample. This sequence encodes a human zeytor17 cytokine receptor that can be used in a comparison with other zcytor17 receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid molecule encoding a type-1 cytokine receptor GLM-R polypeptide. The nucleic acid molecules, polypeptides, antibodies, agonists or antagonist, and compositions are useful for treating disorders characterized by the over or under abundance of monocytes or macrophages. The nucleic acid molecules are useful as hybridization probes, in chromosome and in gene mapping, and generating antisense RNA or DNA. The present sequence represents a cDNA encoding a human GLM-R polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid molecule encoding for treating disorders characterized by the monocytes or macrophages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 3; Fig 1; 156pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              멂
The present invention describes haematopoietic receptor NR10 splicing variants (1), (1) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietin receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence encodes the human NR10.4 protein from the present invention
                                                                                                                                                                                                                 NR10 splicing variants of hematopoietin receptor proteins and encoded genes, applicable in searching hematopoietic factors and developing remedies for immunological and hematopoietic diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes haematopoietic receptor NR10 splicing variants (I). (I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietic receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence encodes the human NR10.4 protein from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NR10 splicing variants of hematopoietin receptor proteins and encoded genes, applicable in searching hematopoietic factors and developing remedies for immunological and hematopoietic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human NR10.4 splicing variant encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes haematopoietic receptor NR10 splicing variants (I). (I) have immunomodulator and haemostatic activities. The proteins and encoded genes are applicable in searching for novel haematopoietic factors, and developing remedies for immunological and haematopoietic diseases. The haematopoietic receptor genes participate in in vivo immunomodulation and haematopoietic cell regulation, and in the search for haematopoietic factors capable of functionally binding to the receptors. The present sequence encodes the human NR10.5 protein from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NR10 splicing variants of hematopoietin receptor proteins and encoded genes, applicable in searching hematopoietic factors and developing remedies for immunological and hematopoietic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 3072 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Fig 10-12; 250pp; Japanese.

i Sequence 17, Application US/09700820C

i Patent No: 6610485

GENERAL INFORMATION:

APPLICANT: Tsuchiya, Masayuki

APPLICANT: Saito, Mikiyoshi

APPLICANT: Ohtomo, Toshihiko

i TITLE OF INVENTION: NOVEL METHOD FOR GENE CLONING

FILE REFERENCE: 06501-070001

CURRENT FILING DATE: 1090-01-30

PRIOR APPLICATION NUMBER: US/09/700,820C

CURRENT APPLICATION NUMBER: UP 10/138652

PRIOR APPLICATION NUMBER: JP 10/279876

PRIOR APPLICATION NUMBER: JP 10/279876

PRIOR FILING DATE: 1998-05-20

PRIOR APPLICATION NUMBER: JP 10/279876

PRIOR FILING DATE: 1998-0-0-01

INUMBER OF SEQ ID NOS: 39

SEQ ID NO 17

LENGTH: 2995

TYPE: DNA

I ORGANISM: Mus musculus

FEATURE:

NAMEKEY: CDS

LOCATION: (29)..(2839)
